

## Introduction

Artix™-7 FPGAs are available in -3, -2, -1, and -2L speed grades, with -3 having the highest performance. The -2L devices can operate at either of two  $V_{CCINT}$  voltages, 0.9V and 1.0V and are screened for lower maximum static power. When operated at  $V_{CCINT} = 1.0V$ , the speed specification of a -2L device is the same as the -2 speed grade. When operated at  $V_{CCINT} = 0.9V$ , the -2L static and dynamic power is reduced.

Artix-7 FPGA DC and AC characteristics are specified in commercial, extended, and industrial temperature ranges. Except the operating temperature range or unless otherwise noted, all the DC and AC electrical parameters are the same for a particular speed grade (that is, the timing

characteristics of a -1 speed grade industrial device are the same as for a -1 speed grade commercial device). However, only selected speed grades and/or devices are available in each temperature range.

All supply voltage and junction temperature specifications are representative of worst-case conditions. The parameters included are common to popular designs and typical applications.

This Artix-7 FPGA data sheet, part of an overall set of documentation on the 7 series FPGAs, is available on the Xilinx website at [www.xilinx.com/7](http://www.xilinx.com/7).

All specifications are subject to change without notice.

2. Typical values are for blank configured devices with no output current loads, no active input pull-up resistors, all I/O pins are 3-state and floating.
3. Use the Xilinx Power Estimator (XPE) spreadsheet tool (download at <http://www.xilinx.com/power>) to calculate static power consumption for conditions other than those specified.

## Power-On/Off Power Supply Sequencing

The recommended power-on sequence is  $V_{CCINT}$ ,  $V_{CCBRAM}$ ,  $V_{CCAUX}$ , and  $V_{CCO}$  to achieve minimum current draw and ensure that the I/Os are 3-stated at power-on. The recommended power-off sequence is the reverse of the power-on sequence. If  $V_{CCINT}$  and  $V_{CCBRAM}$  have the same recommended voltage levels then both can be powered by the same supply and ramped simultaneously. If  $V_{CCAUX}$  and  $V_{CCO}$  have the same recommended voltage levels then both can be powered by the same supply and ramped simultaneously.

For  $V_{CCO}$  voltages of 3.3V in HR I/O banks and configuration bank 0:

- The voltage difference between  $V_{CCO}$  and  $V_{CCAUX}$  must not exceed 2.625V for longer than  $T_{VCCO2VCCAUX}$  for each power-on/off cycle to maintain device reliability levels.
- The  $T_{VCCO2VCCAUX}$  time can be allocated in any percentage between the power-on and power-off ramps.

The recommended power-on sequence to achieve minimum current draw for the GTP transceivers is  $V_{CCINT}$ ,  $V_{MGTAVCC}$ ,  $V_{MGTAVTT}$  OR  $V_{MGTAVCC}$ ,  $V_{CCINT}$ ,  $V_{MGTAVTT}$ . There is no recommended sequencing for  $V_{MGTAVCAUX}$ . Both  $V_{MGTAVCC}$  and  $V_{CCINT}$  can be ramped simultaneously. The recommended power-off sequence is the reverse of the power-on sequence to achieve minimum current draw.

If these recommended sequences are not met, current drawn from  $V_{MGTAVTT}$  can be higher than specifications during power-up and power-down.

- When  $V_{MGTAVTT}$  is powered before  $V_{MGTAVCC}$  and  $V_{MGTAVTT} - V_{MGTAVCC} > 150$  mV and  $V_{MGTAVCC} < 0.7$  V, the  $V_{MGTAVTT}$  current draw can increase by 460 mA per transceiver during  $V_{MGTAVCC}$  ramp up. The duration of the current draw can be up to  $0.3 \times T_{MGTAVCC}$  (ramp time from GND to 90% of  $V_{MGTAVCC}$ ). The reverse is true for power-down.
- When  $V_{MGTAVTT}$  is powered before  $V_{CCINT}$  and  $V_{MGTAVTT} - V_{CCINT} > 150$  mV and  $V_{CCINT} < 0.7$  V, the  $V_{MGTAVTT}$  current draw can increase by 50 mA per transceiver during  $V_{CCINT}$  ramp up. The duration of the current draw can be up to  $0.3 \times T_{VCCINT}$  (ramp time from GND to 90% of  $V_{CCINT}$ ). The reverse is true for power-down.

**Table 6** shows the minimum current, in addition to  $I_{CCQ}$ , that is required by Artix-7 devices for proper power-on and configuration. If the current minimums shown in **Table 5** and **Table 6** are met, the device powers on after all four supplies have passed through their power-on reset threshold voltages. The FPGA must not be configured until after  $V_{CCINT}$  is applied.

Once initialized and configured, use the Xilinx Power Estimator (XPE) tools to estimate current drain on these supplies.

## DC Input and Output Levels

Values for  $V_{IL}$  and  $V_{IH}$  are recommended input voltages. Values for  $I_{OL}$  and  $I_{OH}$  are guaranteed over the recommended operating conditions at the  $V_{OL}$  and  $V_{OH}$  test points. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at a minimum  $V_{CCO}$  with the respective  $V_{OL}$  and  $V_{OH}$  voltage levels shown. Other standards are sample tested.

## AC Switching Characteristics

All values represented in this data sheet are based on the speed specifications in v1.07 from the 14.4/2012.4 device pack for ISE® Design Suite14.4 and Vivado® Design Suite 2012.4 for the -3, -2, -2L (1.0V), and -1 speed grades and v1.05 from the 14.4/2012.4 device pack for the -2L (0.9V) speed grade.

Switching characteristics are specified on a per-speed-grade basis and can be designated as Advance, Preliminary, or Production. Each designation is defined as follows:

### Advance Product Specification

These specifications are based on simulations only and are typically available soon after device design specifications are frozen. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

### Preliminary Product Specification

These specifications are based on complete ES (engineering sample) silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advance data.

### Production Product Specification

These specifications are released once enough production silicon of a particular device family member has been characterized to provide full correlation between specifications and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

## Testing of AC Switching Characteristics

Internal timing parameters are derived from measuring internal test patterns. All AC switching characteristics are representative of worst-case supply voltage and junction temperature conditions.

For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer and back-annotate to the simulation net list. Unless otherwise noted, values apply to all Artix-7 FPGAs.

## Speed Grade Designations

Since individual family members are produced at different times, the migration from one category to another depends completely on the status of the fabrication process for each device. [Table 12](#) correlates the current status of each Artix-7 device on a per speed grade basis.

[Table 12: Artix-7 Device Speed Grade Designations](#)

Device	Speed Grade Designations		
	Advance	Preliminary	Production
XC7A100T	-2L (0.9V)		-3, -2, -2L (1.0V), -1
XC7A200T	-2L (0.9V)		-3, -2, -2L (1.0V), -1

## Production Silicon and ISE Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label (Advance, Preliminary, Production). Any labeling discrepancies are corrected in subsequent speed specification releases.

[Table 13](#) lists the production released Artix-7 device, speed grade, and the minimum corresponding supported speed specification version and ISE software revisions. The ISE software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

This section provides the performance characteristics of some common functions and designs implemented in Artix-7 devices. The numbers reported here are worst-case values; they have all been fully characterized. These values are subject to the same guidelines as the [AC Switching Characteristics, page 9](#).

## IOB Pad Input/Output/3-State

Table 16 summarizes the values of standard-specific data input delay adjustments, output delays terminating at pads (based on standard) and 3-state delays.

- $T_{IOP}$  is described as the delay from IOB pad through the input buffer to the I-pin of an IOB pad. The delay varies depending on the capability of the SelectIO input buffer.
- $T_{IOOP}$  is described as the delay from the O pin to the IOB pad through the output buffer of an IOB pad. The delay varies depending on the capability of the SelectIO output buffer.
- $T_{IOTP}$  is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is disabled. The delay varies depending on the SelectIO capability of the output buffer. In HR I/O banks, the IN\_TERM termination turn-on time is always faster than  $T_{IOTP}$  when the INTERMDISABLE pin is used.

Table 17 specifies the values of T<sub>IOTPHZ</sub> and T<sub>IOIBUFDISABLE</sub>. T<sub>IOTPHZ</sub> is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is enabled (i.e., a high impedance state). T<sub>IOIBUFDISABLE</sub> is described as the IOB delay from IBUFDISABLE to O output. In HR I/O banks, the internal IN\_TERM termination turn-off time is always faster than T<sub>IOTPHZ</sub> when the INTERMDISABLE pin is used.

2. T<sub>RCKO\_DOR</sub> includes T<sub>RCKO\_DOW</sub>, T<sub>RCKO\_DOPR</sub>, and T<sub>RCKO\_DOPW</sub> as well as the B port equivalent timing parameters.
3. These parameters also apply to synchronous FIFO with DO\_REG = 0.
4. T<sub>RCKO\_DO</sub> includes T<sub>RCKO\_DOP</sub> as well as the B port equivalent timing parameters.
5. These parameters also apply to multirate (asynchronous) and synchronous FIFO with DO\_REG = 1.
6. T<sub>RCKO\_FLAGS</sub> includes the following parameters: T<sub>RCKO\_AEMPTY</sub>, T<sub>RCKO\_AFULL</sub>, T<sub>RCKO\_EMPTY</sub>, T<sub>RCKO\_FULL</sub>, T<sub>RCKO\_RDERR</sub>, T<sub>RCKO\_WRERR</sub>.
7. T<sub>RCKO\_POINTERS</sub> includes both T<sub>RCKO\_RDCOUNT</sub> and T<sub>RCKO\_WRCOUNT</sub>.
8. The ADDR setup and hold must be met when EN is asserted (even when WE is deasserted). Otherwise, block RAM data corruption is possible.
9. These parameters include both A and B inputs as well as the parity inputs of A and B.
10. T<sub>RCO\_FLAGS</sub> includes the following flags: AEMPTY, AFULL, EMPTY, FULL, RDERR, WRERR, RDCOUNT, and WRCOUNT.
11. RDEN and WREN must be held Low prior to and during reset. The FIFO reset must be asserted for at least five positive clock edges of the slowest clock (WRCLK or RDCLK).

**Notes:**

1. T<sub>BCCCK\_CE</sub> and T<sub>BCCKC\_CE</sub> must be satisfied to assure glitch-free operation of the global clock when switching between clocks. These parameters do not apply to the BUFGMUX primitive that assures glitch-free operation. The other global clock setup and hold times are optional; only needing to be satisfied if device operation requires simulation matches on a cycle-for-cycle basis when switching between clocks.
2. T<sub>BGCKO\_O</sub> (BUFG delay from I0 to O) values are the same as T<sub>BCCKO\_O</sub> values.

T_DCD_BUFR	Regional clock tree duty cycle distortion	All	0.18	0.18	0.18	0.18	ns

**Notes:**

- These parameters represent the worst-case duty cycle distortion observable at the I/O flip flops. For all I/O standards, IBIS can be used to calculate any additional duty cycle distortion that might be caused by asymmetrical rise/fall times.
- The T\_CKSKEW value represents the worst-case clock-tree skew observable between sequential I/O elements. Significantly less clock-tree skew exists for I/O registers that are close to each other and fed by the same or adjacent clock-tree branches. Use the Xilinx FPGA\_Editor and Timing Analyzer tools to evaluate clock skew specific to your application.

Hold time is measured relative to the global clock input signal using the fastest process, lowest temperature, and highest voltage.
2. IFF = Input flip-flop or latch
3. Use IBIS to determine any duty-cycle distortion incurred using various standards.

**Notes:**

1. This parameter indicates the total sampling error of the Artix-7 FPGAs DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the MMCM to capture the DDR input registers' edges of operation. These measurements include:
  - CLKO MMCM jitter
  - MMCM accuracy (phase offset)
  - MMCM phase shift resolution
 These measurements do not include package or clock tree skew.
2. This parameter indicates the total sampling error of the Artix-7 FPGAs DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the BUFIO clock network and IDELAY to capture the DDR input registers' edges of operation. These measurements do not include package or clock tree skew.

**Additional Package Parameter Guidelines**

The parameters in this section provide the necessary values for calculating timing budgets for Artix-7 FPGA clock transmitter and receiver data-valid windows.

2. Package delay information is available for these device/package combinations. This information can be used to deskew the package.

- Offset and gain errors are removed by enabling the XADC automatic gain calibration feature. The values are specified for when this feature is enabled.
- Only specified for BitGen option XADCEnhancedLinearity = ON.
- See the ADC chapter in [UG480: 7 Series FPGAs XADC User Guide](#) for a detailed description.
- See the Timing chapter in [UG480: 7 Series FPGAs XADC User Guide](#) for a detailed description.
- Any variation in the reference voltage from the nominal V<sub>REFP</sub> = 1.25V and V<sub>REFN</sub> = 0V will result in a deviation from the ideal transfer function. This also impacts the accuracy of the internal sensor measurements (i.e., temperature and power supply). However, for external ratioimetric type applications allowing reference to vary by ±4% is permitted. On-chip reference variation is ±1%.

**Notes:**

1. To support longer delays in configuration, use the design solutions described in [UG470: 7 Series FPGA Configuration User Guide](#).
2. Only during configuration, the last edge is determined by a weak pull-up/pull-down resistor in the I/O.

## eFUSE Programming Conditions

Table 64 lists the programming conditions specifically for eFUSE. For more information, see [UG470: 7 Series FPGA Configuration User Guide](#).
